UNSW skin cancer researcher hit with string of retractions

By [Elise Worthington](#) and [Kyle Taylor](#), ABC Investigations

In the news ...

October 17th 2019

University of
South Australia

<https://www.abc.net.au/news/2019-10-17/unsw-skin-cancer-levon-khachigian-allegations-and-retractions/11585768>

- “six research papers [...] withdrawn or retracted from publication due to unresolved concerns over missing or manipulated data”
- “the same images had apparently been duplicated and then labelled as if they were representing two different things”
- “So the claim that the drug is having effect on cell size is clearly due to a magnification of the image and not an actual effect of the drug.”
- “ ... the authors withdrew the research, admitting they couldn't locate the raw data needed to prove their work.”

What is open science?

A movement aiming to make science
more reliable, transparent and accessible

Letter | Published: 27 August 2018

Evaluating the replicability of social science experiments in *Nature* and *Science* between 2010 and 2015

Colin F. Camerer, Anna Dreber, Felix Holzmeister, Teck-Hua Ho, Jürgen Huber, Magnus Johannesson, Michael Kirchler, Gideon Nave, Brian A. Nosek , Thomas Pfeiffer, Adam Altmejd, Nick Buttrick, Taizan Chan, Yiling Chen, Eskil Forsell, Anup Gampa, Emma Heikensten, Lily Hummer, Taisuke Imai, Siri Isaksson, Dylan Manfredi, Julia Rose, Eric-Jan Wagenmakers & Hang Wu

Nature Human Behaviour 2, 637–644 (2018) | Download Citation 

from the abstract:

We replicate 21 systematically selected experimental studies in the social sciences published in *Nature* and *Science* between 2010 and 2015. The replications follow analysis plans reviewed by the original authors and pre-registered prior to the replications. The replications are high powered, with sample sizes on average about five times higher than in the original studies. We find a significant effect in the same direction as the original study for 13 (62%) studies, and the effect size of the replications is on average about 50% of the original effect size. **Replicability varies between 12 (57%) and 14 (67%) studies for complementary replicability indicators.**

Why open science?
The replicability crisis

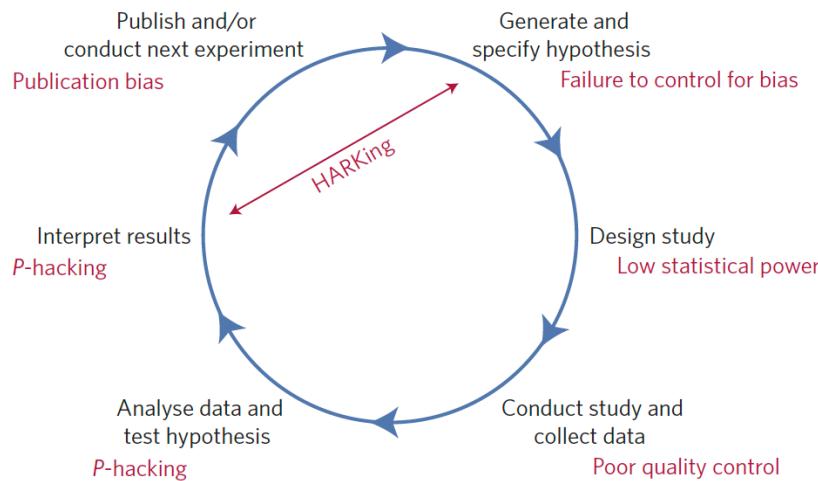

Figure 1 | Threats to reproducible science. An idealized version of the hypothetico-deductive model of the scientific method is shown. Various potential threats to this model exist (indicated in red), including lack of replication⁵, hypothesizing after the results are known (HARKing)⁷, poor study design, low statistical power², analytical flexibility⁵¹, P-hacking⁴, publication bias³ and lack of data sharing⁶. Together these will serve to undermine the robustness of published research, and may also impact on the ability of science to self-correct.

Table 1. Open science practices. Some methods introduced or suggested by the open science community to improve scientific practices.

Resources	Sharing of code, data, research materials, and methods [2,19].
Publishing formats	Registered reports [28], preregistrations [17], exploratory reports [32], preprints [27], open access publishing [33], as well as new evaluation and peer review processes [24].
Research questions	Pursuing replications and reanalyses [2,5,6,9,19].
Methodology	Changes in statistical approaches for power [21,22], how evidence is assessed [23] and communicated [34], as well as documenting data analysis in a way that facilitates reproducing results [35].

Open science: how?

A Code Glitch May Have Caused Errors In More Than 100 Published Studies

The discovery is a reminder that science is collaborative and ideally self-correcting, but that nothing can be taken for granted.

By [Maddie Bender](#)

Oct 10 2019, 11:30pm [Share](#) [Tweet](#)

IMAGE: GETTY

Scientists in Hawai'i have uncovered a glitch in a piece of code that could have yielded incorrect results in over 100 published studies that cited the original paper.

The glitch caused results of a common chemistry computation to vary depending on the operating system used, causing discrepancies among Mac, Windows, and Linux systems. The researchers published the revelation and a debugged version of the script, which amounts to roughly 1,000 lines of code, [on Tuesday in the journal Organic Letters](#).

Some very real benefits

- Your future self will thank you!

University of

Hang on ... what about qualitative research?

Challenges include:

- emergent methodology depending on data
- contextual embedding of data
- sensitivity of data

How OSF supports your research

Search and Discover	Design Your Study	Collect and Analyze Data	Publish Your Reports
			
Search and Discover	Design Your Study	Collect and Analyze Data	Publish Your Reports
Find papers, data, and materials to inspire your next research project. Search public projects to build on the work of others and find new collaborators.	Start a project and add collaborators, giving them access to protocols and other research materials. Built-in version control tracks the evolution of your study.	Store data, code, and other materials in OSF Storage, or connect your Dropbox or other third-party account. Every file gets a unique, persistent URL for citing and sharing.	Share papers in OSF Preprints or a community-based preprint provider, so others can find and cite your work. Track impact with metrics like downloads and view counts.

Wiki

Experiment Icelandic 2 (ICE2) was run by Dietmar Roehm in Iceland in 2005 as part of research conducted by the Max Planck Research Group Neurotypology (Max Planck Institute for Human Cognitive and Brain Sciences, Leipzig; head: Ina Bornkessel-Schlesewsky).
The data were originally analysed using "traditional" ERP analysis methods, i.e. single-subject averaging per condition, time window and elect...

README.md

restingIAF

General information

Source code for `restingIAF`, an automated resting-state individual alpha frequency (IAF) estimation routine implemented in MATLAB.

Repo also contains manuscript preprints (long and short(er) versions, archived on *bioRxiv*) outlining the rationale for programme development, its performance across simulated and non-simulated EEG datasets, and guidelines for parameter settings. The [long version](#) includes a detailed examination of some of the problematical features of conventional approaches to IAF estimation. It also contains additional technical details that were omitted from the [short version](#). Most of these details are collated in the latter's accompanying [appendix](#).

About Journal Clubs Blog Repository Podcast

Welcome to ReproducibiliTea

We are a grassroots [journal club initiative](#) that helps young researchers create local Open Science journal clubs at their universities to discuss diverse issues, papers and ideas about improving science, reproducibility and the Open Science movement. Started in early 2018 at the University of Oxford, ReproducibiliTea has now spread to 41 institutions in 15 different countries, spanning 3 different continents. We are completely volunteer run, and provide a unique and supportive community for our members.

Want to join the movement? Grab your cup of (Reproducibili)tea and use our freely accessible and adaptable materials to start organising your own [journal club](#) today.
